(54) BAND PASS FILTER

(57) Abstract:

PROBLEM TO BE SOLVED: To provide a band pass filter that attenuates an electromagnetic wave in the TM 111 mode.

SOLUTION: A cylindrical cavity resonator 1 of the band pass filter consists of cylinders 11, 12 whose diameters differ from each other and whose axes are substantially made concentric, which are adhered to each other to form a cavity in the inside. The diameter and the length of the axes of the cylinders 11, 12 are selected so that the cylindrical cavity resonator 1 is resonated in the TE 011 mode. since the diameter of a short-circuit face 11a at the cylindrical cavity resonator 1 differs from that of a short-circuit face 12a, the cylindrical cavity resonator 1 can drastically attenuate an electromagnetic wave in the TM 111 mode and bring the resonance frequency in the TM 111 mode to a frequency at the outside of a pass band of the band pass filter.

LEGAL STATUS

[Date of request for examination] 15. 11. 2005

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
